Objective of today's exchange

Present **Eurosystem's analysis on the core principles for the digital euro compensation model.**

Invite you to **share your input as part of a written procedure (deadline 24 March 2023).**

Background

The digital euro
is a **public good**

Natural evolution
of cash in the
digital sphere

It should be **widely available and usable anywhere in the euro area** to make and receive payments.

This needs establishing an appropriate combination of **requirements & economic incentives** providing confidence that **network effects** will be achieved.

Objectives of the compensation model

Core principles for the compensation model

1 Free basic use by private individuals

2 Network effects generating economic incentives for acquirers and merchants

3 Comparable economic incentives for issuers

4 Eurosystem bears its own costs, as with production and issuance of banknotes

Free basic use by private individuals

1 Free basic use by private individuals

- **The digital euro should be free for basic use by private individuals.**
 - **This is consistent with the context of cash, which is a public good as well, where people can pay, be paid, and have access free-of-charge.**
 - **The ‘basic use’ would cover all services necessary to enable persons to pay and be paid with digital euro in a convenient manner.**
- Onboarding to digital euro, opening and holding of a digital euro wallet/account
 - Funding and defunding the digital euro wallet/account from the payment account which the person associates it to
 - Provision of a basic instrument to pay with digital euro
 - Making and receiving Person-to-Person (P2P) payments
 - Making payments to merchants, businesses, or governments (i.e., POI, including POS, e-commerce, and P2G)
 - Receiving payments from governments (G2P)
 - Combinations of the above elements such as waterfall (i.e., receiving a payment and defunding) and reverse waterfall (i.e., funding and making a payment).

Incentives for acquirers and merchants

2 Network effects generating economic incentives for acquirers and merchants

- PSPs offering digital euro acquiring services would be able to **charge merchants** for these services, **in line with cash and other payment methods**, where merchants also face costs.
- Price setting for merchants could be determined by **market forces**. The wide distribution of a digital euro could allow for a more **open competitive space** in the euro area with **greater choice**.
- Co-legislators might decide to implement **safeguards to prevent potential abuse from the legal tender nature of digital euro** (i.e., possible mandatory acceptance). Legislation might establish an **expectation on merchant pricing** considering the current levels for comparable retail payment solutions.

Comparable incentives for issuers

3 Comparable economic incentives for issuers

- PSPs distributing digital euro and offering wallet/account management services to private individuals should have a **similar level of economic incentives** to do so as for electronic payment alternatives.
- This is to ensure an **effective distribution of a public good** like the digital euro.
- The objective is that PSPs have **comparable incentives** to promote an **optimal usability** and **end-user experience** as they have with alternative electronic payment instruments they distribute.

Eurosystem bears its own costs

4 Eurosystem bears its own costs, as with production and issuance of banknotes

- The Eurosystem will **bear its own costs**, reflecting the **public good nature** of the digital euro.
- **Same logic which currently applies to cash.**
- PSPs would have their own costs related to the distribution of the digital euro services they provide, but they would **not be charged Eurosystem costs** such as those related to **scheme management** and **settlement processing**.

For feedback

We invite reflections by
participants

What are your views on the
suggested core principles
for the digital euro
compensation model?

Thank you for
your attention
